RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 24 pages. Original publisher: Madison, WI (One Gifford Pinchot Dr. , Madison 53705-2398) : U. S. Dept. of Agriculture, Forest Service, Forest Products Laboratory : National Wood in Transportation Information Center ; in cooperation with the U. S. Dept. of Transportation, Federal Highway Administration, 2000. OCLC Number: (OCOLOC)48094869 Subject: Truss bridges -- Maine -- Evaluation. Excerpt: . . . stress relaxation are primary sources of bar force loss in solid guide specifications require a minimum bar force of ap-2 for this bridge. Therefore, it is recom-stress-laminated decks. However, additional bar force loss proximately 45 lb in mended that the bars be retensioned to the design value of was expected for the Byron bridge structure because of the 2 2 125 lb in whenever the bar force is below 45 lb in. seating of the metal plate connectors into the wood of adja-cent trusses. Behavior Under Static Load At the time of the design and construction of the bridge, the magnitude and duration of the bar force loss were unknown. For each load case, transverse deflections are given at the However, data collected during the 53 months of monitoring bridge centerspan as viewed from the south end (looking showed that the bar force has not stabilized. Although the north). No permanent residual deflection was measured rate of prestress loss decreased with each retensioning, bar between load cases or at the conclusion of load testing. In 2 in the force still decreased approximately 75 to 30 lb in addition, no significant movement was detected at the bridge 33 months prior to the last retensioning. Because of the supports during testing. At the time of both load tests, the ongoing bar force loss, it is recommended that the bar...
